

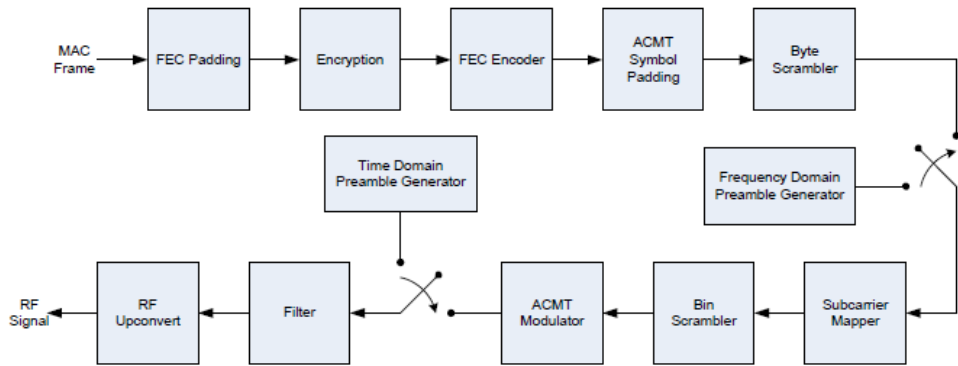

EXHIBIT 12

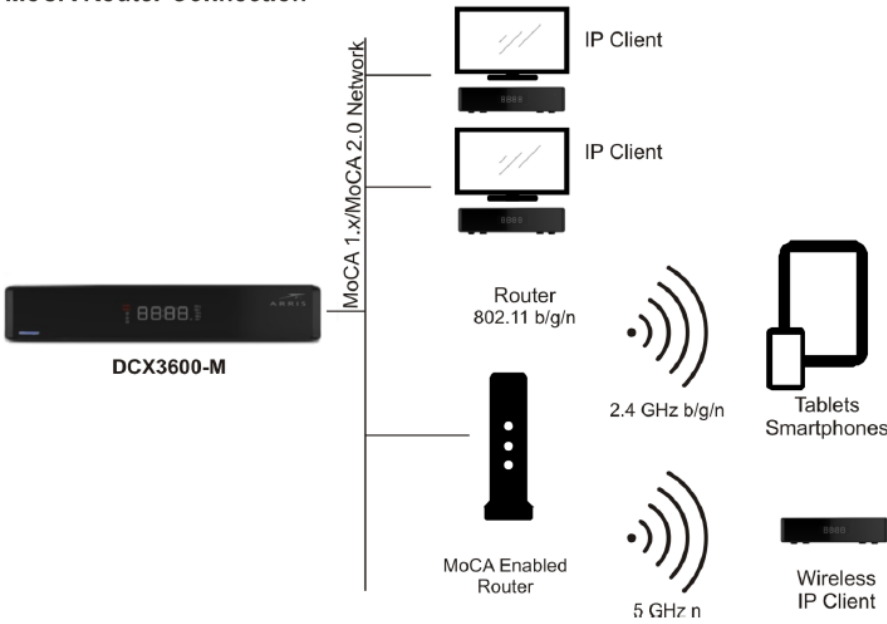

U.S. Patent No. 8,621,539 (“the ’539 Patent”) Exemplary Infringement Chart

The Accused MoCA Instrumentalities are instrumentalities that Charter deploys to provide a whole-premises DVR network over an on-premises coaxial cable network, with devices operating with data connections compliant with MoCA 1.0, 1.1, and/or 2.0. The Accused MoCA Instrumentalities include the Charter Arris DCX3510, Charter Arris DCX3520, Charter Arris DCX3600, Charter Arris DCX3200, Charter Arris DCX3220, and substantially similar instrumentalities. Charter literally and/or under the doctrine of equivalents infringes the claims of the ’539 Patent under 35 U.S.C. § 271(a) by making, using, selling, offering for sale, and/or importing the Accused MoCA Instrumentalities.

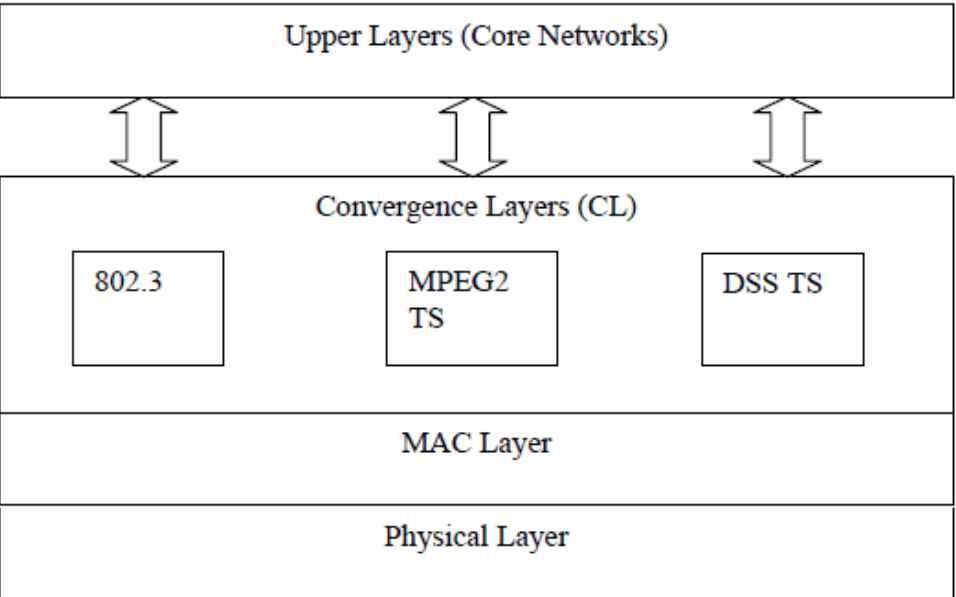

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the ’539 Patent
1. A modem for communication to at least one node across at least one channel of a coaxial network, the modem comprising:	<p>The Accused Services are provided using at least the Accused MoCA Instrumentalities including gateway devices (including, but not limited to, the Charter Arris DCX3510, Charter Arris DCX3520, Charter Arris DCX3600, and devices that operate in a similar manner), client devices (including, but not limited to, the Charter Arris DCX3200, Charter Arris DCX3220, and devices that operate in a similar manner), and substantially similar instrumentalities. The Accused MoCA Instrumentalities operate to communicate to at least one node across at least one channel of a coaxial network as described below.</p> <p>The Charter full-premises DVR network constitutes a coaxial network as claimed. The Charter full-premises DVR network is a MoCA network created between gateway devices and client devices using the on-premises coaxial cable network. This MoCA network is compliant with MoCA 1.0, 1.1, and/or 2.0.</p> <p>“The MoCA system network model creates a coax network which supports communications between a convergence layer in one MoCA node to the corresponding convergence layer in another MoCA node.” (MoCA 1.0, Section 1. <i>See also</i> MoCA 1.1, Section 1.1; MoCA 2.0, Section 1.2.2)</p>

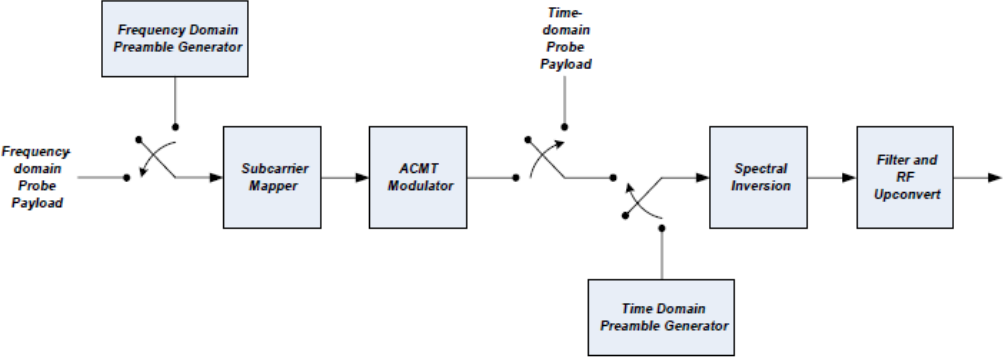

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the '539 Patent
	<p>“The MoCA Network transmits high speed multimedia data over the in-home coaxial cable infrastructure.” (MoCA 1.0, Section 2. <i>See also</i> MoCA 1.1, Section 2; MoCA 2.0, Section 5)</p> <p>“PHY data packets carry MAC data and control frames as PHY payload. Figure 4-3 shows an example of how a PHY data packet is constructed from a MAC frame. In this example, the FEC-padded MAC frame is encrypted and encoded into two Reed-Solomon code words, the last code word being shortened to minimize FEC padding. The encoded data is ACMT padded, scrambled and modulated onto the sub-carriers of three ACMT symbols. The ACMT symbols are bin-scrambled and then transformed to the time-domain where a cyclic prefix is added to each ACMT symbol to obtain the PHY data payload. Finally, a preamble is prepended to the PHY data payload and is filtered and upconverted to RF for transmission onto the media. In practice, the number of Reed-Solomon code words and number of ACMT symbols per PHY data packet will vary as a function of the MAC frame size and modulation profile. The processing steps referred to here are specified in Section 4.3.” (MoCA 1.0, Section 4.2.1.2. <i>See also</i> MoCA 1.1, Section 4.2.1.2, MoCA 2.0, Section 14.2)</p>

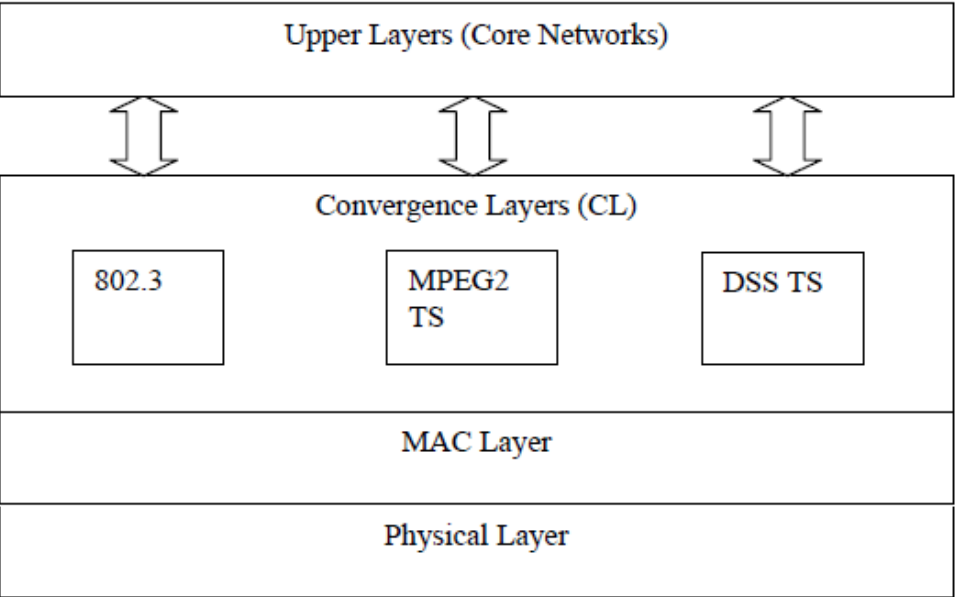

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the '539 Patent
	 <p>The flowchart illustrates the PHY Data Packet Transmission Processing. It begins with a 'MAC Frame' input to a 'FEC Padding' block. The output of 'FEC Padding' goes to 'Encryption', which then goes to 'FEC Encoder'. The output of 'FEC Encoder' goes to 'ACMT Symbol Padding', which then goes to 'Byte Scrambler'. The output of 'Byte Scrambler' goes to a switch. The other input to the switch is from a 'Frequency Domain Preamble Generator'. The output of the switch goes to a 'Subcarrier Mapper' block. The output of 'Subcarrier Mapper' goes to a 'Bin Scrambler' block. The output of 'Bin Scrambler' goes to an 'ACMT Modulator' block. The output of 'ACMT Modulator' goes to a switch. The other input to this switch is from a 'Time Domain Preamble Generator'. The output of this switch goes to a 'Filter' block. The output of 'Filter' goes to an 'RF Upconvert' block. The output of 'RF Upconvert' is the 'RF Signal'.</p> <p>Figure 4-2. PHY Data Packet Transmission Processing</p> <p>(MoCA 1.0, Figure 4-2. <i>See also</i> MoCA 1.1, Figure 4-2, MoCA 2.0, Figure 14-2)</p> <p>“The MoCA MAC protocol is built on a fully coordinated TDMA channel. It is a distributed network where one of the nodes is automatically selected to be the Network Coordinator (NC), which is responsible for generating the timing and resource allocation for the entire network.”</p> <p>(MoCA 1.0, Section 2.3.1. <i>See also</i> MoCA 1.1, Section 2.3.1, MoCA 2.0, Section 7.4)</p> <p>“In the Admission Request message, the NN MUST send a signal level value indicating how much the NC is to reduce transmit power for subsequent probe transmissions. This information MUST be conveyed back to the NC in the INITIAL_PWR_ADJUSTMENT field of the Admission Request frame. The NC MUST use the value of this INITIAL_PWR_ADJUSTMENT to scale down from its maximum transmit power the power of subsequent probes the NC transmits to the NN.”</p>

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the '539 Patent
	<p>(MoCA 1.0, Section 3.10.2.1 <i>See also</i> MoCA 1.1, Section 3.10.2.1, MoCA 2.0, Section 7.11.2.1)</p> <p>Charter utilizes the MoCA standard to provide an on-premises DVR network over an on-premises coaxial cable network as shown below:</p> <p>MoCA Router Connection</p>  <p>Figure 5 - A Typical Mixed MoCA/WiFi Home Network</p>
a transmitter; and	The Accused MoCA Instrumentalities include a transmitter as described below.

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the '539 Patent
	<p>For example, by virtue of their compliance with MoCA, the Accused MoCA Instrumentalities include circuitry and/or associated software modules constituting a transmitter.</p> <p>“The MoCA system includes convergence layers for core networks such as IEEE 802.3 (Ethernet), video streams (i.e., MPEG-2 transport) and digital satellite streams (i.e. DSS transport). The MoCA system network model creates a coax network which supports communications between a convergence layer in one MoCA node to the corresponding convergence layer in another MoCA node. The protocol stack of a MoCA node is shown in Figure 1-1. The protocol stack consists of the physical layer, the MAC layer and one or more convergence layers (CL).” (MoCA 1.0, Section 1. <i>See also</i> MoCA 1.1, Section 1; MoCA 2.0, Section 5.1)</p>

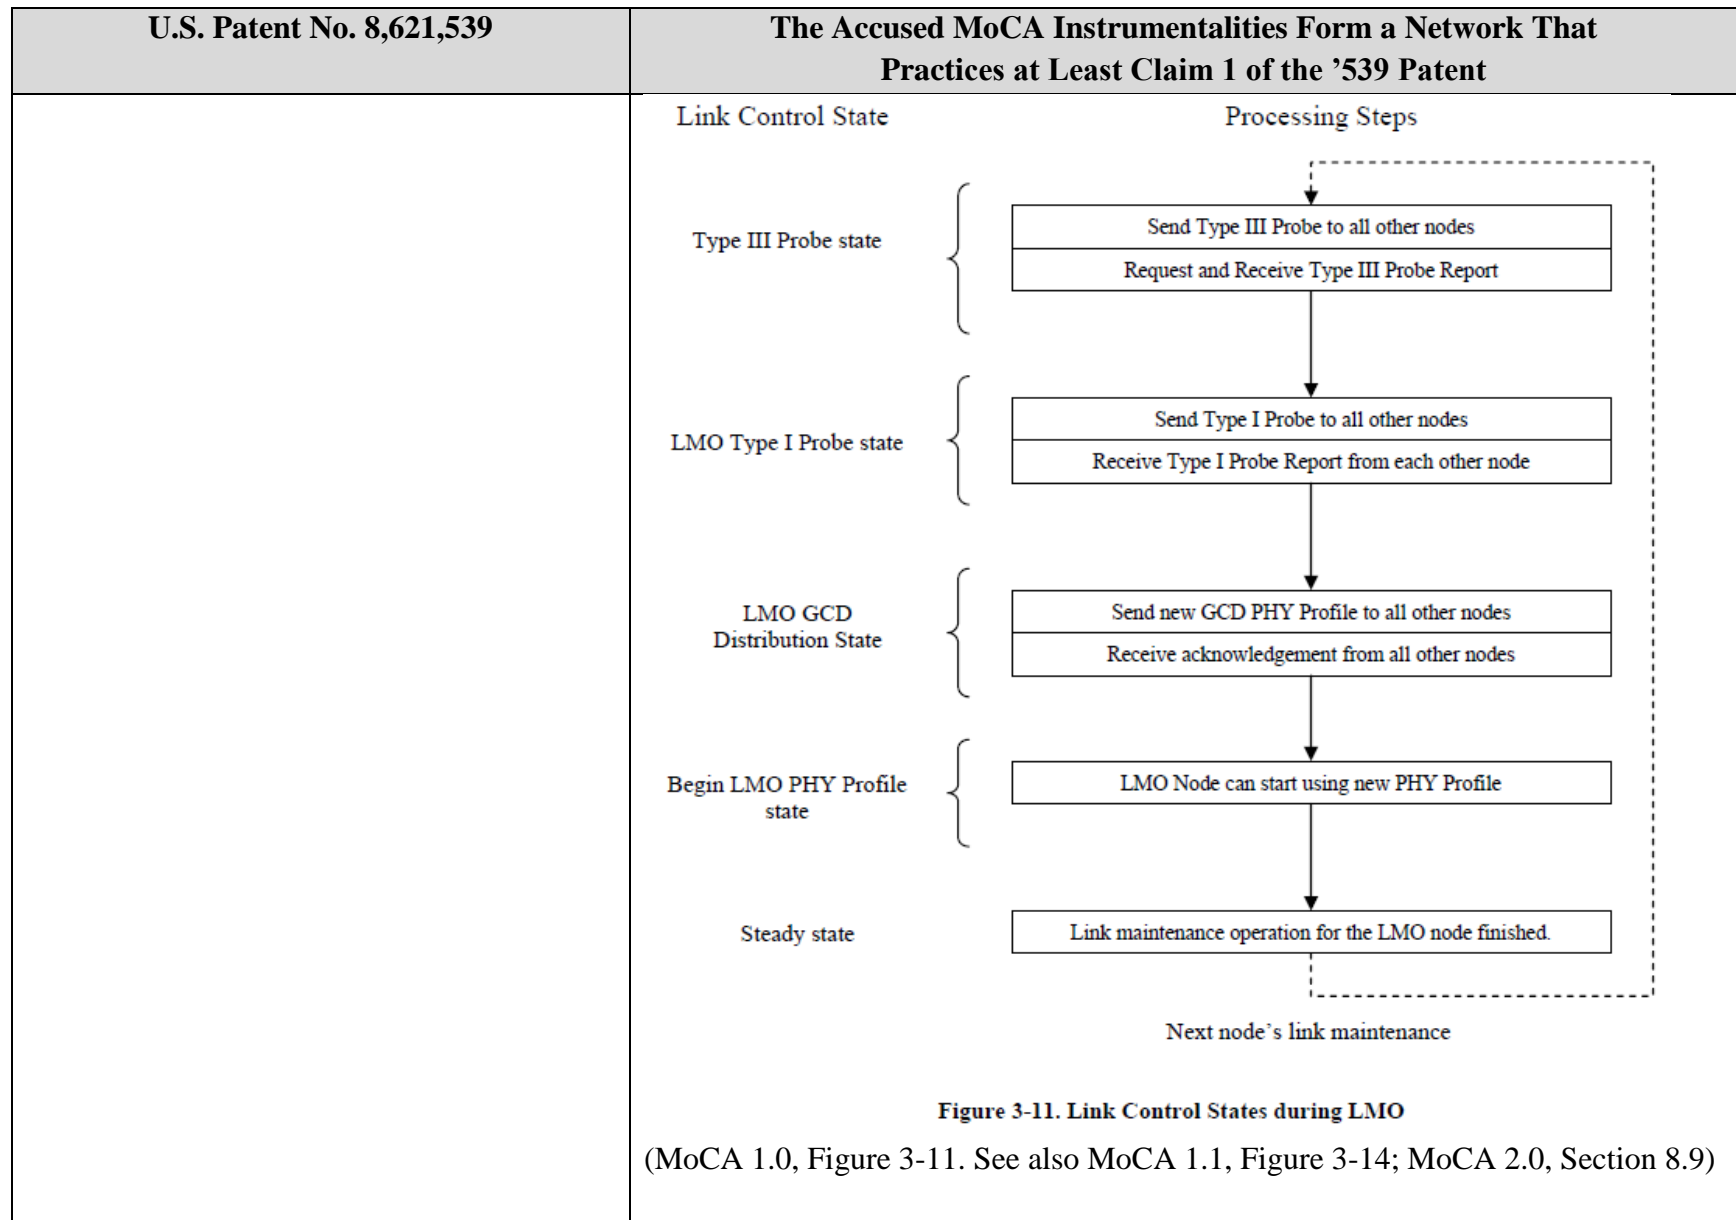

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the '539 Patent
	 <p>The diagram illustrates the MoCA Node Protocol Stack. It consists of five main layers, from top to bottom: Upper Layers (Core Networks), Convergence Layers (CL), MAC Layer, and Physical Layer. The Convergence Layers (CL) are further divided into three sub-layers: 802.3, MPEG2 TS, and DSS TS. Bidirectional arrows connect the Upper Layers (Core Networks) to the Convergence Layers (CL), indicating communication between these two sections. The MAC Layer and Physical Layer are shown as single blocks below the Convergence Layers.</p> <p>Figure 1-1. MoCA Node Protocol Stack (MoCA 1.0, Figure 1-1. <i>See also</i> MoCA 1.1, Figure 1-1; MoCA 2.0, Figure 5-1)</p>

	<p>(MoCA 1.0, Figure 1-1. <i>See also</i> MoCA 1.1, Figure 1-1; MoCA 2.0, Figure 5-1)</p> <p>“The NC MUST indicate the beginning of the LMO signal exchange for a node by indicating the Link Control State “Type III Probe” (LINK_STATE = 0x07) and by setting LMO_NODE field of asynchronous MAPs to the Node ID of the LMO Node. The LMO_DESTINATION_NODE should always be set to 0x3F. Subsequently, all nodes MUST follow signal exchanges defined in this section.”</p> <p>(MoCA 1.0, Section 3.7. <i>See also</i> MoCA 1.1, Section 3.7; MoCA 2.0, Section 8.9)</p> <p>“A variety of physical layer frequency-domain and time-domain probes are used to create modulation profiles, optimize performance, and allow for various calibration mechanisms. Type I Modulation Profile Probes are frequency domain probes used to determine modulation profiles of the channel between any two nodes. Type II Probes are frequency domain probes consisting of two tones that may be used to fine tune performance. A Type III Echo Profile Probe may be used to determine the impulse response of the channel. This information can be used to optimize various physical layer parameters. In addition to the above probes, this specification provides opportunities for various unique Loopback Transmissions which may be useful for RF calibration, among other things.”</p> <p>(MoCA 1.0, Section 2.2. <i>See also</i> MoCA 1.1, Section 2.2; MoCA 2.0, Section 5.2)</p> <p>“As shown in Figure 3-11, the first state for the LMO of a node is the Type III Probe State. In this Link Control state, the LMO node transmits Type III Probes to all other nodes and receives reports back from them. This state is followed by the LMO Type I Probe state. In this Link Control state, the LMO node transmits Type I Probes to all other nodes and receives Type I Probe Reports back from them. The next Link Control state is the LMO GCD Distribution state. In this state, the LMO node sends</p>

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the '539 Patent
	<p>the newly computed GCD PHY Profile to all other nodes and receives acknowledgements back from them. The next Link Control state is the Begin LMO PHY Profile state. The LMO node can begin using its new PHY Profile after the NC indicates this state in asynchronous MAPs.”</p> <p>(MoCA 1.0, Section 3.7.1. See also MoCA 1.1, Section 3.7.1; MoCA 2.0, Section 8.9)</p>

U.S. Patent No. 8,621,539	The Accused MoCA Instrumentalities Form a Network That Practices at Least Claim 1 of the '539 Patent
	<p>“After the previous signal exchanges, the LMO Node MUST request bandwidth to broadcast N11 Type III Probes to all nodes in the network. For scheduling the transmission of the Type III Probes, the LMO node MUST request transmission time of 2164 SLOT_TIMES7. This bandwidth MUST be requested by receiving asynchronous MAPs and sending a reservation request. Details of Type III Probe are given in Section 4.5.3. [...] The NC and EN’s MUST receive these probe transmissions and use them to re-calculate the CP_LENGTH parameter of PHY profile.” (MoCA 1.0, Section 3.7.2.2. <i>See also</i> MoCA 1.1, Section 3.7.2.2; MoCA 2.0, Section 8.9)</p> <p>“Once an EN sends its Type III probe report, it MUST begin reporting next state (LMO Type I Probe state) in its Reservation Requests. When the LMO node receives probe reports from all other nodes (relayed by the NC), it MUST begin reporting the next Link Control state (LMO Type I Probe state) in its Reservation Requests. Once the NC receives next state indication in the Reservation Requests of all nodes, it changes the Link Control state of the network to “LMO Type I Probe” state. In this Link Control State, the transmit channel from the LMO node to all other nodes in the network (including NC) is characterized and the modulation used on this channel is optimized. The signal exchange diagram of Figure 3-13 shows the messages exchanged during this state.” (MoCA 1.0, Section 3.7.3. <i>See also</i> MoCA 1.1, Section 3.7.3; MoCA 2.0, Section 8.9)</p>
